

WRITTEN PLAN

- Create the basic structure of the site according to the wireframe.
- Add the JSON objects, just like the database created.
- Use Vue for displaying the thumb images, by creating a js file in components (inside JS) and exporting it to HTML via JS. All the functions we call in HTML are initialized in JS.
- When we click on the thumb images, if the given condition is true, load the lightbox using Vue, which showcases further details about the selected car.
- Once this both are working, add images and text, to make the site more friendly.
- Make it responsive and do the styling part.
- Create a database using the information, and using json.php and connect.php connect this file to the database.
